The BGCKr protein can be expressed by standard recombinant prolification, are receptor proteins possibly involved in modulation of proinflammatory or stimulatory functions of chemokines; cell proliferation, migration, adhesion and targeting, and exocytosis. The and modulators are potentially useful for modulating inflammation; chemoattractant activity of leucocytes; angiogenesis; cell proliferation; virus into cells, for therapeutic or prophylactic purposes. They are also rearranged for diagnosis and in drug-screening assays. The present sequence

SP proteins can be used to stimulate cell proliferation or to treat or prevent cancer. SP antagonists are preventing neuronal disorders or immune responses. Polynucleotide sequences complementary to the SP-encoding polynucleotides are useful for the detection of SP-encoding nucleic acid molecules in biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                121 LNEVSGMQFLACISIDRYVAVTKVPSQSGVGKPCWIICFCVMMAAILLSIPQLVFYTVND 180

The polypeptides can be used to identify agents which modulate VSHK-1 receptor signal transduction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel diagnostic agent (A) comprising at least two different ligands (I) for receptors (II) that are implicated in CC disease. (A) are used for the diagnosis of tumors (especially colorectal or prostatic), organ rejection, inflammation and autoimmune diseases. CC inflammation, or autoimmune diseases therapeutically against tumors (and their cc where the (cardio)vascular, lymphatic, respiratory, nervous, digestive, cc marrow diseases. The products of the invention are affected, and bone cc immunosuppressive, dermatological, antiinflammatory, antiasthmatic, and bone cc constellation of chemokine serior tumor and inflammatory cells through a cc constellation of chemokine receptors (CR), which control migration and consideration of chemokine receptors (CR), which control migration and cc fragments used to illustrate the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       neural disorders, pain response disorders and inflammatory disorders e.g. atherosclerosis, angina pectoris and mycoardial infarction, ischaemic heart disease, sudden cardiac death, hypertensive heart disease, diabetes, prostate cancer-related pain, diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel human G protein-coupled receptors (GPCR) named 1983, 52881, 2398, 45449, 50289 and 52872. The novel GPCRs and nucleic acids encoding them are useful for identifying agents for the treatment of cardiovascular disorders, angiogenesis-related disorders,

Schweickart Epp A, Raport CJ, Chantry Steiner

An isolated polynucleotide encoding the chemokine receptor CCR11, useful for treating rheumatoid arthritis, inflammatory bowel disease, asthma, angiogenesis, artherosclerosis, cardiac arrhythmias, Raynaud's phenomenon and migraine

Page 96-97; 110pp; English.

The present sequence represents the human chemokine receptor CCR11 (CCR11 is a member of the G protein coupled receptor family. A CCR11 polypeptide, its inhibitor, an antibody, or other modulator of CCR11 expression or biological activity, is useful for treating many inflammatory diseases, for example, rheumatoid arthritis, inflammatory bowel disease, and asthma. They are also useful for treating angiogenesis, artherosclerosis vascular association diseases which may include but are not limited to hypertension, angina pectoris, cardiac arrhythmias, left ventricular disastolic dysfunction, Raynaud's phenomenon, migraine, preterm labour, oesophageal spasm, ischaemic stroke, subarachnoid haemorrhage, myocardial infarction, congestive stroke, subarachnoid haemorrhage, myocardial heart failure, endometriosis, vasospasm, reti vascular disease. endometriosis, vasospasm, retinopathy, nephropathy,

                                                                                                                                                                                                        -mediated condition such as inflammation, allergy, an autoimmune disease, graft rejection, cancer, an infectious disease or an immunosuppressive disease. The present sequence represents the human CCX CKR polypeptide.
                                                                                                                                                                                                                                                                          The invention relates to an isolated or recombinant chemokine receptor designated CCX CKR) polypeptide which binds to chemokines such as ELC, SLC or TECK. The CCX CKR polypeptide is useful for identifying CCX CKR modulators. An agent that modulates the activity or expression of CCX CKR in a cell or tissue in the mammal is useful in the treatment of a CCX CKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated or recombinant chemokine receptor (designated CCX CKR) polypeptide (P1) or its fragment, useful for identifying CCX CKR modulators which can be used in the treatment of inflammation, allergy,
                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 4; Fig 1; 72pp; English.

```

This sequence encodes a G-coupled receptor, HFIAO41 which is useful diagnosing susceptibility to diseases by detecting mutations in the HFIAO41 gene, and can diagnose diseases associated with HFIAO41 period with HFIAO41 polypeptide expression levels. Agon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polypeptide expression. HFIAO41 antibodies are useful for inducing an immune response to immunise and prevent disease, and for isolating HFIAO41 clones or purifying the polypeptides by affinity chromatography. HFIAO41 polypeptides can be administered directly or as a vaccine to inoculate against disease. Diseases diagnosed, prevented and treated include bacterial, fungal, protozoan and viral infections, particularly HIV-1 or -2 infections; cancer; diabetes; anorexia; bulimia; Parkinson's disease; acute heart failure; hypotension; hypertension; urinary retention; osteoporosis; angina pectoris; myocardial infarction; ulcers;
                                                                                                                                              white blood cell dysfunction
                                                                                                                                                                                             A human seven-pass transmembrane receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   asthma; allergies; benign prostatic hypertrophy; and psychotic and neurological disorders, including anxiety, schizophrenia, manic depression, delirium, dementia, severe mental retardation and dyskinesias such as Huntington's disease or Gilles de la Tourette's syndrome. The HFIAO41 polypeptide is also useful for mapping the gene to a chromosome,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and antagonists of the protein can be used in treatment to activate (agonist) or inhibit (antagonist) HFIA041 activity, in addition to direct administration of antisense sequences to prevent expression, or HFIA041 polynucleotides to treat conditions associated with a lack of FIA041

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a seven-pass transmembrane receptor protein. The protein and its DNA can be used to screen substances for the diagnosis, prevention and treatment of autoimmune diseases, particularly those due to white blood cell dysfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New seven-pass transmembrane receptor protein useful for treating, preventing or diagnosing autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     N-PSDB;

The orphan GPCR of the invention, like all GPCRs has seven transmembrane alpha helices with an extracellular N-terminus and an intracellular C-terminus. However, no endogenous ligands has yet been identified for the proteins of the invention. The orphan GPCRs may be used in the identification of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins may also be used in the study of GPCR-mediated signalling cascades, and to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present amino acid sequence is the hPPR1, an endogenous human orphan G protein-coupled receptor (GPCR), expressed in the pituitary gland, heart, salivary gland, small intestine and testis. The hPPR1 cDNA was identified using EST (expressed sequence tag) AA359504 and 238667 as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 42; Page 69-70; 102pp; English.

The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous ligand is unknown (orphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can he reaful for

The present sequence is human tuberous sclerosis complex 7 (TSC7). TSC7 polynucleotides and polypeptides are useful for determining the presence or predisposition to a disease associated with altered levels of TSC7. TSC7 polynucleotides, polypeptides and antibodies specific for the polypeptide are useful for treating or preventing pathological conditions associated with the disorder in a G-protein mediated pathway. They are useful for diagnosing a hyperproliferative condition such as a neoplasm or dermatological condition. TSC7 nucleic acids and polypeptides are useful in the treatment of microbial infections, pain, cancer, anorexia, asthma, autoimmune disorders. Parkinson's disease, acute heart failure, hypo/hypertension, osteoporosis, multiple sclerosis, angina pectoris.
                                                                                    dementia, severe mental retardation and dyskinesias, such as Huntington's disease and/or other pathologies and disorders.
                                                                                                                                      myocardial infarction, ulcers, allergies, benign prostatic hypertrophy and psychotic and neurological disorders, including schizophrenia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mediated pathway such as cancer, neurological disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proliferation, migration, adhesion and targeting, and exocytosis. The BGCKr nucleic acids and derived proteins (or their variants), antibodies and modulators are potentially useful for modulating inflammation; chemoattractant activity of leucocytes; angiogenesis; cell proliferation; tumour growth; allergic reactions and entry of human immune deficiency virus into cells, for therapeutic or prophylactic purposes. They are also used for diagnosis and in drug-screening assays. The present sequence

The present sequence represents the bovine chemokine receptor CCR11. CCR11 is a member of the G protein coupled receptor family. A CCR11 polypeptide, its inhibitor, an antibody, or other modulator of CCR11 expression or biological activity, is useful for treating many inflammatory diseases, for example, rheumatoid arthitis, inflammator bowel diseases, and asthma. They are also useful for treating angiogenesis, artherosclerosis vascular association diseases which ma include but are not limited to hypertension, angina pectoris, cardiac arrhythmias, left ventricular diastolic dysfunction, Raynaud's phenomenon, migraine, preterm labour, oesophageal spasm, ischaemic stroke, subarachnoid haemorrhage, myocardial infarction, congestive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oesophageal spasm; ischaemic stroke; subarachnoid haemorrhage; myocardial infarction; congestive heart failure; endometriosis; vasospasm; retinopathy; nephropathy; pulmonary vascular disease
